1. Scope

This specification is only applicable to FP51200LFP-RM 10240Wh rack type battery. This product is composed of 3.2V 200AH new lithium iron phosphate battery, which adopts 16S 1P mode. The battery pack adopts scientific internal structure design, advanced BMS system, industry-leading production technology, high specific energy, long life, safety and reliability. It has the characteristics of wide temperature range and is an ideal green energy storage power product.

| - | | | |
|----|--------------------|--|--|
| | | | protection is triggered, the charging MOS is disconnected, and the current limiting charging is entered. The charging current refers to the setting mode. |
| | | Passive current limiting recovery mode | 1. Recover once every 38 minutes; 2. Meet any one of the following conditions (full charge, overvoltage protection, discharge, current is 0 for 2.5 minutes), current limit recovery. |
| | | Power on/activation | In the sleep state, press the key for about 3s to activate. After the LED indicator lights up in turn, it turns to the normal working state; |
| 22 | Manual key setting | Shutdown/Sleep | In the power on state, press the key for 3 seconds and then release it. The BMS is dormant. After the LED indicator lights up in turn, the BMS goes into the sleep state; |
| | | Reset | In the power on state, the BMS is reset after pressing the key for 6s. |
| 23 | Sleep function | BMS sleep | When any of the following conditions are met, the system enters the low power consumption mode: 1. The single or Pack over-discharge protection has not been released within 30 minutes (configurable). 2. Release the button after pressing the button for 3 seconds. 3. The minimum cell voltage is lower than the sleep voltage (configurable), and the duration reaches the sleep delay time (default 30min, while satisfying no communication and no current). 4. The standby time is more than 1 hour (0.5 to 2 hours can be configured) (no communication, no charge and discharge, no charger access). 5. Forced shutdown through the host computer software. Before entering the sleep mode, make sure that the input terminal is not connected to external voltage, no external communication, and the button is not pressed, otherwise it will not be able to enter the low power consumption mode. |
| 24 | Activate function | BMS activation | When the system is in low power consumption mode and meets any of the following conditions, the system will exit the low power consumption mode and enter the normal operation mode: 1. Connect the charger, the output voltage of the charger must be greater than 48V. 2. Press the button for 3S and release the button. 3. Connect the communication line and start the software of the upper computer (it enters the sleep state due to over-discharge protection, this method cannot wake up the protection board). |

8. Block Diagram

9. Communication description

1) RS485 communication

| Spec.No. | |
|----------|-----|
| Rev. | V/1 |

The BMS should have the RS485 host computer communication and cascading communication functions of the battery pack, and the default baud rate is 9600bps.

Data is transmitted between the BMS battery pack and the host computer. Its communication protocol refers to "YD/T 1363.3 Communication Bureau (Station) Power Supply, Air Conditioning and Environmental Centralized Monitoring and Management System Part 3: Front-end Intelligent Device Protocol" and "BMS Modus Protocol". When the charging and discharging current is not 0, BMS does not allow firmware upgrades.

BMS485 cascading communication interface adopts 8P8C straight PCB welding telephone socket (round pin),. The BMS is configured with an RS485 interface. when cascading battery packs, the upper computer is the master, and all battery packs are slaves. The upper computer polls the data of each battery pack in the cascade system and uploads it. RS485 communication interface is defined in the following table.

RS485 interface definition - 8P8C vertical RJ45 socket

2) Four remote functions

12

Telemetry: battery pack total voltage, battery pack capacity (SOC), battery pack state of health (SOH), single cell voltage, battery pack charging/discharging current, number of cycles (discharging more than 80% of the nominal capacity is 1 cycle), Cumulative discharge capacity, maximum and minimum cell voltage, ambient temperature /

| Spec.No. | |
|----------|-----|
| Rev. | V/1 |

battery pack temperature (4 temperature for battery, 1 for ambient, and 1 for MOSFET), historical data, alarm and protection records, etc.

Remote signaling: protection function status, battery pack charging/discharging status, battery pack total voltage high alarm, battery pack total voltage low alarm, cell charge overvoltage alarm, cell discharge undervoltage alarm, battery pack short circuit, battery pack Charging overvoltage/overcurrent alarm, battery pack discharge undervoltage/overcurrent alarm, battery pack capacity low alarm, battery pack reverse polarity alarm, cell high/low temperature alarm, ambient high temperature/low temperature alarm, MOSFET temperature alarm, Low battery capacity alarm, cell failure alarm (optional), fire equipment startup alarm, etc.

Remote control: protection function status, alarm sound on/off, intelligent intermittent charging mode, current limiting charging mode, charging on/off, discharge start/stop, etc.

Remote adjustment: various functional states and parameter setting range, matching parameters between BMS and switching power supply system output performance.

3) CAN communication (with CAN communication interface, user can choose)

| Pin | Definition description | Port Description | Top view |
|---------------|------------------------|-------------------|-----------|
| 4 | CANH | | 12345678 |
| 5 | CANL | CAN communication | [/////] |
| 7 | GND | interface | |
| 1, 2, 3, 6, 8 | NC | | |

4) Parallel communication

13

When multiple machines are connected in parallel, the inverter is connected to one of the RJ45 ports of the battery master through a standard network cable, the master is connected to the slave through the other RJ45 port, and the communication lines of the other slaves are connected sequentially. The connection diagram is as follows:

The master requests the battery information of all slaves and summarizes them for the inverter to query all battery information, and the BMS slaves

Fax: +86-755-28851555

| Spec.No. | |

| Rev. | V/1 |

communicate with each other.

Dip switch address

14

When battery packs are used in parallel, different PACKs can be distinguished by the hardware address, each PACK address is unique. And the hardware address can be set sequentially through the dial switch on the board. For the definition of the switches, see the following table.

10. Cell

15

| No | Items | Test Method and Condition | Criteria |
|----|---------------------------------|--|----------|
| 1 | Rated Capacity at 0.2C(Min.) | After standard charge, the capacity shall be measured on 0.2C discharge till the voltage discharge to32.0v, | ≥99% |
| 1 | Rated Capacity at 0.5C(Min.) | After standard charge, the capacity shall be measured on 0.5C discharge till the voltage discharge to 32.0v, | ≥98% |

| Spec.No. | |
|----------|-----|
| Rev. | V/1 |

| | | Rated Capacity at 1C(Min.) | After standard charge, the capacity shall be measured on 1C discharge till the voltage discharge to 32.0v, | ≥96% |
|---|---|--|---|---|
| | 2 | Cycle Life | Charging and discharging battery as blew conditions 0.2C standard charge to 58.4V end-off 0.2C standard discharge to 40V cut-off Continuous charge and discharge fo 6000 cycles ,the capacity will be measure after the 6000 th cycle | ≥80% of initial capacity |
| - | 3 | Capacity retention | The battery to be charge in accordance with standard charge condition at $20\sim2^{\circ}\mathbb{C}$, then storage the battery at an ambient temperature $20\sim25^{\circ}\mathbb{C}$ for 28 days. Measure the capacity after 28 days with 0.2C at $20\sim25^{\circ}\mathbb{C}$ as retention capacity | Retention capacity ≥80% |
| | 4 | Temperature Dependence of discharge capacity | Cells shall be charged per 10 and discharged @0.2 C ₅ A to 32.0 volts. Except to be discharged at temperatures per Table 11-1. Cells shall be stored for 3 hours at the test temperature prior to discharging and then shall be discharged at the test temperature. The capacity of a cell at each temperature shall be compared to the capacity achieved at 23 °C and the percentage shall be calculated. | The discharge capacity of the temperature must be no less than that specified in Table 11-1 |

Table 11-1

17

| Discharge Temperature | -10℃ | -5℃ | 0°C | 23℃ | 55℃ |
|---|------|------|------|------|------|
| Discharge Capacity (0.2 C ₅ A) | >70% | >80% | >85% | >98% | >98% |

12. Mechanical characteristics

| No | Items | Test Method and Condition | Criteria |
|----|----------------|---|----------|
| 1 | Free fall test | The battery to be fully charged in accordance with standard charge condition, then drop the battery three times from a height of 1,0 m onto a concrete floor. The batteries are dropped so as to obtain impacts in random orientations. | No Fire, |

| Spec.No. | |
|----------|-----|
| Rev. | V/1 |

| 2 | Vibration test | After standard charging, fixed the cell to vibration table and subjected to vibration cycling that the frequency is to be varied at the rate of 1Hz per minute between 10Hz and 55Hz, the excursion of the vibration is 1.6mm. The cell shall be vibrated for 30 minutes per axis of XYZ axes. | No explosion ,No leakage, No fire |
|---|----------------|--|-----------------------------------|
|---|----------------|--|-----------------------------------|

13. Safety performance

| No | Items | Test Method and Condition | Criteria |
|----|-----------------------|--|--|
| 1 | Thermal exposure test | Each fully charged cell, stabilized at room temperature, is placed in a circulating air-convection oven. The oven temperature is raised at a rate of 5 °C/min \pm 2 °C/min to a temperature of 130 °C \pm 2 °C. The cell remains at this temperature for 10 min before the test is discontinued. | No explosion, No fire |
| 2 | Shor-Circuit test | The fully charged battery is to be short-circuited by connecting the positive and negative terminals of the battery with resistance load not exceed $100 \mathrm{m}\Omega$. Tests are to be conducted at room temperature $20 \sim 25$ °C. | No explosion, No fire The Temperature of the Battery surface not exceeded than 150°C |
| 3 | Shor-Circuit test | The fully charged battery is to be short-circuited by connecting the positive and negative terminals of the battery with resistance load not exceed $100 \text{m}\Omega$. Tests are to be conducted at room temperature about $60\text{-}65^{\circ}\text{C}$ | No explosion, No fire The Temperature of the Battery surface not exceeded than 150°C |
| 4 | Forced discharge test | A discharged cell is subjected to a reverse charge at 1C for 90 min. | No explosion, No fire |
| 5 | Over-charge test | After standard charge, continue to charge with a constant voltage 1C/4.2V per a cell, holding 12h. | No explosion, No fire |

14. Cell initial Dimensions

15. Product installation

Pay special attention to:

- > Please ensure that the positive and negative pole interfaces of the battery box are under insulation protection!
- ➤ Please ensure that the battery box is closed!
- The guide rail or battery rack must be installed in the cabinet, then the battery box must be placed on the guide rail or battery rack, and then the battery box must be fixed on the cabinet column!
- Each battery box must be supported by a separate guide rail and cannot be stacked directly. After installation, at least one floating nut clearance shall be reserved between boxes!
- All battery boxes must be set from top to bottom (1 #, 2 #,..., 14 #, 15 #, if necessary) to set the dial switch ID. The battery box ID in the system cannot be repeated!
- All connections must use appropriate terminals to ensure reliable connection!
- > The positive and negative poles shall not be short circuited, and the battery box shall not be connected in series!

Attention of equipment or personnel!

- This equipment is very heavy. Please use a safe and feasible installation method according to the weight of the equipment.
- Be sure to use the recommended number of screws to fix the battery box to the mounting bracket.

| Spec.No. | |
|----------|-----|
| Rev. | V/1 |

- Be sure to use the recommended number of screws and floating nuts to fix the battery box to the cabinet.
- ➤ Be sure to install the battery box at or near the bottom of the cabinet.

Rack or cabinet installation

Please install it in an appropriate cabinet or rack according to the size of the product, and lock it on the cabinet with four M5 bolts and left and right lugs;

The panel grounding point shall be grounded with more than 6 square meters of yellow rolled green copper wire, and the grounding shall be good;

Use red and black flexible wires to connect the positive and negative poles of the battery output terminal on the chassis to the positive and negative poles of the switching power supply or the device respectively. Note that the positive and negative poles cannot be reversed; the wire connected to the battery output terminal needs to have an OT terminal at one end., which is locked on the output terminal by the M6 combination screw. 50Ah systems are recommended to 8 AWG wires, 100Ah systems are recommended to 6 AWG or 4AWG wires;

16. Handling of Cells

16.1. Prohibition short circuit

Never make short circuit battery. It generates very high current which causes heating of the cells and may cause electrolyte leakage, gassing or explosion these are very dangerous.

The LIR tabs may be easily short-circuited by putting them on conductive surface.

Such outer short circuit may lead to heat generation and damage of the cell.

An appropriate circuitry with PCM shall be employed to protect accidental short circuit of the battery pack.

16.2. Mechanical shock

Falling, hitting, bending, etc. may cause degradation of lithium battery characteristics.

17. Notice for Designing Battery Pack

17.1. Pack toughness

Battery pack should have sufficient strength and the lithium battery inside should be protected from mechanical shocks.

17.2. Cell fixing

The lithium battery should be fixed to the battery pack by its large surface area.

No cell movement in the battery pack should be allowed.

17.3. Inside design

No sharp edge components should be insides the pack containing thelithium battery.

17.4. Tab connection

21

Ultrasonic welding or spot welding is recommended for lithium battery tab connection method.

Battery pack should be designed that shear force are not applied to the lithium battery tabs.

If apply manual solder method to connect tab with PCM, below notice is very important to ensure battery performance:

Shenzhen All Technology Co., Ltd

Spec.No.

Rev. V/1

- 1) The solder iron should be temperature controlled and ESD safe;
- 2) Soldering temperature should not exceed 350°C;
- 3) Soldering time should not be longer than 3s;
- 4) Soldering times should not exceed 5 times, Keep battery tab cold down before next time soldering;
- 5) Directly heat cell body is strictly prohibited, Battery may be damaged by heat above approx. 100°C
- 17.5. For mishaps

Battery pack should be designed not to generate heat even when leakage occurs due to mishaps.

- 1) Isolate PCM (Protection Circuit Module) from leaked electrolyte as perfectly as possible.
- 2) Avoid narrow spacing between bare circuit patterns with different voltage.(Including around connector)

lithium battery should not have liquid from electrolyte, but in case If leaked electrolyte touch bare circuit patterns, higher potential terminal material may dissolve and precipitate at the lower potential terminal, and may cause short circuit. The design of the PCM must have this covered.

18. Notice for Assembling Battery Pack

Shocks, high temperature, or contacts of sharp edge components should not be allowed in battery pack assembling process.

19. Others

22

- 19.1. Cell connection
- 1) Direct soldering of wire leads or devices to the cell is strictly prohibited.
- 2) Lead tabs with pre-soldered wiring shall be spot welded to the cells.

Direct soldering may cause damage of components, such as separator and insulator, by heat generation.

19.2. Prevention of short circuit within a battery pack

Enough insulation layers between wiring and the cells shall be used to maintain extra safety protection. The battery pack shall be structured with no short circuit within the battery pack, which may cause generation of smoke or

Shenzhen All Technology Co., Ltd

Fax: +86-755-28851555

| Spec.No. | |
|----------|-----|
| Rev. | V/1 |

firing.

19.3. Prohibition of disassembly

1) Never disassemble the cells

The disassembling may generate internal short circuit in the cell, which may cause gassing, firing, explosion, or other problems.

2) Electrolyte is harmful

Lithium battery should not have liquid from electrolyte flowing, but in case the electrolyte come into contact with the skin, or eyes, physicians shall flush the electrolyte immediately with fresh water and medical advice is to be sought.

19.4. Prohibition of dumping of cells into fire

Never incinerate nor dispose the cells in fire. These may cause explosion of the cells, which is very dangerous and is prohibited.

19.5. Prohibition of cells immersion into liquid such as water

The cells shall never be soaked with liquids such as water, seawater, drinks such as soft drinks, juices, coffee or others.

19.6. Battery cells replacement

23

The battery replacement shall be done only by either cells supplier or device supplier and never be done by the user.

19.7. Prohibition of use of damaged cells

The cells might be damaged during shipping by shock. If any abnormal features of the cells are found such as damages in a plastic envelop of the cell, deformation of the cell package, smelling of an electrolyte, an electrolyte leakage and others, the cells shall never be used any more.

The Cells with a smell of the electrolyte or a leakage shall be placed away from fire to avoid firing or explosion.

| Spec.No. | |
|----------|-----|
| Rev. | V/1 |

20. Period of Warranty

The battery is guaranteed for two years free of charge and then for a paid warranty from the date of shipment. The company is responsible for the return and replacement of batteries if defects develop during the manufacturing process and are not caused by user abuse or incorrect use.

21. Storage of the Batteries

The battery shall be stored in a dry warehouse at a temperature of -20 \sim 45°C and a humidity of \leq 95% without condensation. Keep away from flammable, explosive and corrosive chemicals or heat sources and water sources, and avoid exposure to sunlight, rain and water.

If the battery is expected to be stored for more than 30 days, it is recommended to adjust the SOC to about 50%. The longest charging cycle of the battery at -10~30°C is every 6 months, the longest charging cycle at 30~45°C is every 3 months, and the longest charging cycle at 45~65°C is every 1 month; The above charging cycle is the recommended value, and the actual storage SOC is not less than 8%, which is not affected by BMS or other self consumed power except single battery. We recommend that the battery be charged every six months to prevent excessive discharge.

22. Other The Chemical Reaction

Because batteries utilize a chemical reaction, battery performance will deteriorate over time even if stored for a long period of time without being used. In addition, if the various usage conditions such as charge, discharge, ambient temperature, etc. are not maintained within the specified ranges the life expectancy of the battery may be shortened or the device in which the battery is used may be damaged by electrolyte leakage. If the batteries cannot maintain a charge for long periods of time, even when they are charged correctly, this may indicate it is time to change the battery.

Note:

24

Any other items which are not covered in this specification shall be agreed by both parties.
